

Getting Started Guide

Predatar Client Installation

Installing the Predatar Client software.

The Predatar Client software can be found in the **Next Steps** email once you have activated your account. Download the client installer and license file to the same folder on the host server which the Predatar client software will be installed.

The Predatar client software can then be installed by following the steps listed below:

- Right click on the executable file and select 'Run as administrator' from the pop-up menu.
- Follow the wizard and agree to the terms of the license agreement.
- The client key (license) will only be displayed if it resides in the same folder as the client .exe file.
- Select the Predatar client key for which you wish to install the Predatar client on this server
- Choose the path where you want to install the Predatar client
- Input your proxy details if this is required
- Review the settings and then the Predatar client will be installed on the server.

If you wish to install multiple instances of the Predatar client on different host servers, make sure that the **GenX Client keys** are unique for each server.

Please contact insights@predatar.com for further keys

Predatar Client Configuration

Configuring The Predatar Client software.

The Predatar GUI allows you to manage and control Spectrum Protect and Spectrum Protect Plus servers that are being monitored by the Predatar client instance from that server.

- Add each SP and SPP server by clicking the '+' icon on the left menu next to the appropriate server
- Complete the details in the pop-up window to connect to the server (SPP server URL's must start with `http://` or `https://` and ends with `/`)
- Once all servers are added, select one of the servers by clicking on it
- Click on the hamburger icon and select 'Run all alerts and reports'
- After a few minutes, data will start appearing on the portal under Analytics and Events.

You are now ready to head to the portal and take control of your data.
